

CLIENT GUIDE

Aarogya Hospital Management

Introduction Usage and Workflow

Connected hospital workflow

Aarogya is a role-based hospital workflow demonstration that keeps reception, queues, clinical care, pharmacy, inventory and activity history connected through one shared patient record.

Administrator control centre with patient flow, collections and operational attention items.

What the client should understand

- Each team sees a focused workspace while using the same underlying visit record.
- Critical handoffs are visible: registration to queue, consultation to pharmacy, and dispensing to stock.
- Important actions remain traceable in an append-only activity trail.

Outcome. A single calm workspace replaces disconnected verbal updates between hospital teams.

Patient arrival to live queue

Patients can begin at the hospital desk or use the self-registration link. Reception remains the confirmation point before a token is issued.

Patient entry screen separates existing and new patient journeys.

- 1. Start the record** The patient self-registers or reception searches and creates the arrival.
- 2. Verify the patient** Reception confirms identity, contact details, age, reason for visit and assigned doctor.
- 3. Complete arrival checks** Add available vitals, confirm Cash or verified UPI payment, and flag an emergency only after verbal confirmation.
- 4. Issue the token** The visit, payment, token and doctor queue are saved together.

Reception confirmation and the doctor-specific live queue.

Outcome. The care team can see who is waiting, who is prioritised and who has completed consultation.

Consultation to pharmacy

Clinical consultation and the signed-prescription pharmacy worklist.

- 1. Call and confirm** The clinician opens the waiting patient from the queue and confirms the active record.
- 2. Document care** Enter the required diagnosis, clinical advice and prescription details.
- 3. Review stock advice** Medicine availability is advisory; the doctor keeps clinical control of the prescription.
- 4. Sign the consultation** Signing creates an immutable clinical snapshot and releases the prescription to pharmacy.
- 5. Dispense and bill** Pharmacy reviews the signed prescription, selects Cash or verified UPI, and completes invoice and stock deduction together.

Safe handoff controls

- Pharmacy acts only on a signed prescription.
- Short-stock and out-of-stock medicines are visible before dispensing.
- Payment, invoice and stock movement are committed as one pharmacy flow.

Outcome. The clinical decision remains with the doctor while the dispensing team receives a clear, authorised work item.

Inventory and accountability

Batch-level medicine inventory and a searchable activity trail.

Inventory view

- Monitor current quantity, batch, expiry date and reorder threshold.
- Spot healthy, low-stock and out-of-stock items at a glance.
- Use first-expiry-first-out preparation to support safer batch selection.

Audit trail

- See who performed an action, when it happened and which record was affected.
- Trace reception payments and tokens, signed consultations, prescriptions, pharmacy invoices and dispensing.
- Search the fictional demonstration history during a client walkthrough.

Outcome. Operational teams gain visibility into stock risk while management gains a clear history of important actions.
